SUMMARY

Software developer at Evoq Technologies and a dual-enrollment student at CSN/NSHS. I build web applications, internal tools, backend systems, and my own projects in IoT, CAD, and robotics.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, C++, HTML, CSS, Java, PHP
Web: React, Next.js, Vue, Node.js, REST APIs
Databases: PostgreSQL, SQLite, DynamoDB
Cloud: AWS Lambda, Cognito, API Gateway, S3, Lightsail, Vercel, Railway, Cloudflare R2
Other: Authentication, RBAC, Stripe, Three.js, embedded systems, CAD, Android SDK

EXPERIENCE

Software Developer

Evoq Technologies Corp – Nov 2025 - Present

- Build and maintain web applications, internal tools, and the company's main website.
 - Built customer intake and certification systems with dashboards for staff to review and manage submissions.
 - Developed a CAPA workflow for issue intake, risk scoring, corrective actions, and follow-up.
 - Forked Headwind MDM's Android agent and built a custom kiosk launcher and restricted Settings app for Samsung field devices.
 - Implemented Android Device Owner policies, Lock Task Mode, technician access, and kiosk recovery logic. V1 source complete; device testing pending.
-

PROJECTS

Struct:

IoT Gateway · Jul 2026 – Present

[GitHub](#)

- Built a TCP/UDP gateway for embedded devices to send compact binary telemetry instead of JSON over HTTPS.
- Designed an authenticated binary protocol using schema versions, timestamps, nonces, and HMAC replay protection.
- Built schema tooling, generated C++ headers, telemetry storage, device management, signed webhooks, and Stripe billing.
- Built a device simulator and ESP32 example for testing the protocol from MCU hardware.
- Tech: Nuxt, Vue, TypeScript, Node.js, PostgreSQL/Supabase, Stripe, Rust.

Variable-Reach Catching Arm:

Robotics Project · Sep 2026 – Present

[GitHub](#)

- Designing a three-axis robotic arm that predicts the path of a thrown foam ball and changes its reach during interception.
 - Designed the vision, trajectory-estimation, interception-planning, and motor-control architecture.
 - Created actuator sizing, torque calculations, CAD, BOM, simulation, Teensy firmware skeleton, and host-side planning software.
 - Designed a telescoping belt-driven boom with approximately 0.7–1.2 m reach while keeping the total hardware budget under \$500.
 - Current stage is simulation, CAD, controls development, and hardware bring-up. Physical catch-rate testing has not started.
-

EDUCATION

- College of Southern Nevada
- GPA: 4.19
